**ABSTRACT**

Mobile virtualization is a key technology for enabling mobile devices to run multiple operating systems. This paper presents the VMware Mobile Virtualization Platform (MVP) which is a hypervisor for mobile devices. The MVP is designed to be lightweight and efficient, and is implemented in a hardware-accelerated manner. The MVP is designed to be portable and to support a wide range of mobile devices. The MVP is designed to be secure and to provide a high level of isolation between virtual machines. The MVP is designed to be easy to use and to provide a rich set of features. The MVP is designed to be scalable and to support a large number of virtual machines. The MVP is designed to be flexible and to support a wide range of operating systems. The MVP is designed to be robust and to provide a high level of reliability. The MVP is designed to be secure and to provide a high level of security. The MVP is designed to be easy to use and to provide a rich set of features. The MVP is designed to be scalable and to support a large number of virtual machines. The MVP is designed to be flexible and to support a wide range of operating systems. The MVP is designed to be robust and to provide a high level of reliability. The MVP is designed to be secure and to provide a high level of security.
